port actions

The diagram illustrates the flow of data between two modules. On the left is the 'Count within Range' module, which has several input ports (represented by grey circles) and one output port. On the right is the 'Display Console Window' module, which has one input port and three output ports. Four teal arrows originate from the output port of the 'Count within Range' module and point to the 'Write Line' port of the 'Display Console Window' module. The label 'port actions' is positioned at the bottom center, indicating the nature of these connections.
